

I agree to eliminate the element 1 morse code test. Element 1 morse code test is not a test for voice communications. It does not make any sense to test element 1 morse code for voice communication on the HF bands. There is no element 1 code test, (no-code technician) class for voice communication for UHF/VHF. What makes the difference on element 1 morse code testing on HF bands for voice communications but no testing element 1 morse code requirement for voice communication on UHF/VHF bands? The 2 modes of communication, voice, CW are very different. Element 1 morse code testing is not needed for voice communications on any amateur band. Make element 1 morse code testing an option for those hams who want to learn and use CW mode of communication. Thank you.
